This invention describes a novel method of desensitizing a patient to a polypeptide allergen and comprises administering to the patient a peptide derived from the allergen where restriction to a MHG Class II molecule possessed by the patient can be demonstrated for the peptide and the peptide is able to induce a late phase response in an individual who possesses the MHG Class II molecule. The methods can be used for deseniatising patients to allergens present in e.g. grass, tree and weed (including ragweed) pollens, fungi and moulds, foods, stinging insects, the chiromidae (non-biting midges), spiders and mites, housefly, fruit fly, sheep blow fly, screw worm fly, grain weevil, silkworm, honeybee, non-biting midge larvae, bee moth larvae, mealworm, cockroach, larvae of renibrio molitor beetle, mammals such as cat, dog, horse, cow, pig, sheep, rabbit, rat, guinea pig, mice or gerbil. They can also be used to produce immunological vaccines which may be used to prevent and/or treat conditions involving hypersensitivity to allergens. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò

The method comprises administrating a composition that contains polypeptide antigens in an amount that generates in the individual a state of antigensiveness to the antigen to allow desensitisation to one or more polypeptide antigens. The method of the invantion has immunomodulator activity, and may have a use in gene therapy. The composition and method are useful in manufacturing a medicament for desensitising an individual to a selected polypeptide antigen to allow desensitisation to one or more polypeptide to the antigen to allow desensitisation to one or more polypeptide antigens. The present sequence is used in the exemplification of the

This invention describes a novel method of desensitizing a patient to a polypeptide allergen and comprises administering to the patient a peptide derived from the allergen where restriction to a MHC Class in molecule possessed by the patient can be demonstrated for the peptide and the peptide is able to induce a late phase response in an individual who possesses the MHC Class II molecule. The methods can be used for desensitising patients to allergens present in e.g. grass, tree and weed including ragweed) pollens, fungi and moulds, foods, stinging insects, the chiromidae (non-biting midges), spiders and mites, housefly, fruit fly, screw worm fly, grain weevil, silkworm, honeybee, non-biting midge larvae, bee moth larvae, mealworm, cockroach, larvae of renibrio molitor beetle, mammals such as cat, dog, horse, cow, pig, sheep, rabbit, rat, guinea pig, mice or garbil. They can also be used to produce immunological vaccines which may be used to prevent and/or treat conditions involving hypersensitivity to allergens. This sequence

```
to allow desensitisation to one or more polypeptide antigens. The method of the invention has immunomodulator activity, and may have a use in gene therapy. The composition and method are useful in manufacturing a medicament for desensitising an individual to a slected polypeptide antigen or for generating in the individual a state of hyporesponsiveness to the antigen to allow desensitisation to one or more polypeptide antigens. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antinflammatory; infection; vaccine; meningitis; gene therapy.
                                                                        Desensitizing an individual to a selected polypeptide antigen comprises administering a composition containing polypeptide antigens in an amount that generates a state of hyporesponsiveness to the antigen to allow
                                                                                                                                                                                                       to a selected polypeptide antigen. The method comprises administering a composition that contains polypeptide antigens in an amount that generates in the individual a state of hyporesponsiveness to the antigen
                                                                                                                                                                                         The invention relates to a novel method for desensitising an individual
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fraser C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                                                                                                   18-JUN-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                       23-JUN-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      29-JUN-1999
 The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5813 sequences (61), given in the specification. The proteins have antibacterial and antihilammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

The transformants are cultured in medium containing methanol as carbon source to synthesise Lithreonine. See also AAQ48929 and AAQ48931-Q48932. (Updated on 24-OCT-2003 to standardise OS field)

against several pathogens, especially pathogens associated with respiratory and digestive diseases. The pathogens are especially selected from feline leukaemia virus (FeUV), feline pan-leukaemia virus (FPV), feline calcivirus (FVV), feline immunodeficiency virus (FIV), or rabies virus. The vaccines are preferably composed of polynucleotide sequences encoding 3 antigens, all as part of vectors. This sequence represents the gag protein from the feline leukaemia virus (FeLV) subtype A strain Glasgow-1. The coding sequence was sub-cloned into the plasmid pVRI012 to generate plasmid pPB181 for use in the vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Multi-valent polynucleotide vaccines against feline pathogens - consist of at least 3 plasmids able to express protective antigens from specified
